ABHISHEK KUMAR DWIVEDI

[redacted]

Exp: 17 years into engineering
Specialisation: Android OS, Security, Yocto Linux, Embedded devices
Product : Automotive digital cockpit **|** Android TV **|** IoT gateways
Programming : C++, C, Python, Java, JavaScript

[redacted]

Current Role:
- Technical lead
- System architecture
- Android and Yocto linux
- Systems and TARA analysis
- Cyber security product owner

Programming
- Primary: algorithm, C++, C
- Additional: Java, Python, NodeJS

Past one year:
- AOSP, Yocto, QNX, OTA, UDS, telematics, KMS, Architecture and development, team leading

Embedded firmware
- ARM core and internals
- Assembly code understanding
- Schematics, electronics component and debugging

Embedded Linux and OS:
- WiFi, BT, network
- Audio, Multimedia
- USB, SPI, I2C
- Yocto linux
- Peripheral bring-up
- Embedded hardware modules
- Hypervisor, QEMU
- Kernel driver and configuration
- Bootloader(u-boot, GRUB)

Engineering practices:
- Product Lifecycle Management
- Product roadmap
- INCOSE ISO 15288
- ASPICE ISO 15504
- C-SEC ISO 21434
- UN R155, R156
- Agile model
- Requirement grooming
- System design (UML)
- Concept, HLD and LLD
- Security across product life cycle

Others:
- Hardware debugging and probing
- AWS cloud infra
- Entrepreneurship - business model, marketing model, product roadmap and strategy, business issues, process optimization.

Summary

Product development with product cycle in agile and V model ALM; expertise into software architecture and component development across the Android stack, low level embedded interfaces and linux. Proficient into cyber security management and control implementation under ISO 21434. Working into complex softwares involving virtualized multi OS, multi processor, tooling, backend and embedded peripherals. Security PO and technical lead to ensure product security implementation. Self motivated, fast learner and ownership driven.

Education

MS: King's College London, London UK *(full time in person)* **09/2021 - 09/2022**
MSc in Strategic Entrepreneurship and Innovation (Thesis into corporate human capital development)
[Business Model | Venture Capital | Product and process innovation | Marketing strategy | Product pitching | Start-up to growth trajectory]
Pitched business to investors (green energy and SaaS business) | built strategic stakeholder and suppliers

BE :KLE College of Engineering and Technology, India *(full time in person)* **09/2001 - 07/2005**
B.E. in Telecommunication

[redacted]

PROFESSIONAL EXPERIENCES

2016 to Till date

Automotive systems and security for Harman (Android and Linux)
Description: Principal engineer for systems & security domains including Android HAL, OS internals, vendor implementation for diagnostics, issues finding in TEE debug, KMS, software update, virtualization environment and kernel security. Stakeholders engagement for requirement grooming, high level technical specifications, system design, software design, component development. Work requires expertise in Android and Linux, hardware peripherals, generalist to overall system as well as system of system (such as GPS, bluetooth, WiFi, tuner, HTA, BIOS, kernel, bootloader, android systems internals, KPI, power, applications) and Autosar knowledge. Hands-on coding in C++ and Java. Product and process optimization areas findings.

Android TV / STB development for Technicolor
Description: As a principal engineer, to work with chip vendors, partners, Netflix, and internal few teams, resolving android TV low level issues. Contribution to product strategy. Work required some technical understanding of Codec, Multimedia, DRM, TEE OS, HDMI, power states and HAL implementations. Expertise in coding skills and analytical skills were the primary requirement. Work involved hands on into C++, Java, python and NodeJS.

Peripheral bring-up in Android device for Robert Bosch
Description: To add touch screen (I2C) and HDMI, modules to Qulacomm board, to interface external microcontroller to the device for controlling motors and sensors and make it working from kernel layer bring-up as well as implementation of Android framework service to build control stack. Worked at hardware debugging with I2C sniffer and CRO probe along with hardware engineers to go through schematics and PCB. Android customization as per product requirements.

[startup] **Smart Home (IoT) gateway development**
Description: Yocto Linux bring-up into Intel board and pkgmgr. IoT gateway interface with several sensor controllers, such as LED strip, relay, analog sensors etc using low level interfaces, such as I2C, GPIO, USB, UART. ARM mBed for BLE gateway and end node interface. REST interface - Java, C, Android. Did research on building a dashboard and to come out with suitable frameworks. Built machine learning based smart city camera based on tensorflow and yolo with OCR and DNN model. Additionally used dlib SDK for motion tracing. Got traction for investment and built seed fund investor partnership.

[contractor] **Yocto based Embedded gateway bring-up for Intel**
Platform: Intel 32 bit and 64 bit processor
Description: To interact with customers and build secure IoT gateway device development based on Yocto and Intel secure boot . Had to work on Grub bootloader, linux kernel, peripheral bring-up(bluetooth, WiFi, Zigbee) and iotivity stack bringup and package manager implementation for application sandboxing. NodeJs bringup, customised Yocto recipe as per customer requirement. Worked on four such different devices all based on Intel 32 bit and 64 bit processors.

[startup] **Android traveller application and cloud development**
Description: Implemented Android solution with MongoDB, NodeJS, Express into DevOps. Implemented data analysis at cloud for learning user activity and providing suggestions. Used facebook API, Google place API, Google Maps API, recyclerview and fragments for application development. Did marketing of the built solution to find potential partners and VC to invest in further expansion of the MVP. Got market traction.

[startup] **Smart city gateway development**
Description: Requirement analysis and worked on ESP8266 based multi node network solution for interfacing nodes over MQTT and REST interfaces to gateway. Built gateway, coded in Node-RED, for complete solution. Built a team of new engineers to work on firmware.

Automotive BSP for AMD (Android and Linux)
Description: Worked on android and Linux BSP software customization, hypervisor, VirtIO. Working at android IO systems, QEMU and Xen hypervisor configuration. Knowledge of BIOS, inter processor communication, in depth knowledge of AOSP, android emulation, GRUB configuration were needed to troubleshoot issues. Also did performance matrix and optimization for hypervisor, linux, Android OS and BIOS. Worked on intel architecture and android runtime analysis for ABI translation.

[startup] **Connected vehicle Startup business plan**
Business: Pitched business plan to VCs in London with marketing, funding plan and 5 year roadmap. Tested market interest and hypothesis test and built a small founding team, however didn't proceed due to financial risk. Built partners successfully to foster the implementation and scaling the solution in the green energy field. Demonstrated startup MVP strategy to reduce the cost.

Telematics RIL development based on Yocto and Android for LG
Description: Code customization in Telephony + RIL framework, based on Android, C++ coding for telematics devices. Coding standards followed based on automotive MISRA compliance and Yocto based OS. Good hands on with C++ coding required to perform my job. Coding was the primary work.

[contractor] **Smart home gateway hub development**
Platform: Dabian Linux, Android, Google cloud, Google voice assistant
Programming: NodeJS
Description: Port Linux OS into Mediatek based embedded board, integrated wake word detection engine and google voice assistant; fixing issues around peripheral, u-boot environment, kernel device tree. Implemented NodeJS based service interfacing BLE and Android OS customization. RNN AI algorithm integration and dataset update.

Android O based Automotive infotainment HAL development
Platform: Android O for Car | Programming: C, C++
Description: Did design automotive Car HAL as an architect in UML and design discussion with Sr. technical architects. Implementation of code based on design and to do further development. To explore android automotive HAL interfaces and higher stack provided by Google and mentoring other engineers for reference app implementation for verification of HAL implementation. To mentor application integrator engineers and resolve issues. To make pre-built client applications to work on Android O.

*[startup]***Implementation of various embedded devices**
Platform: Broadcom processor, NodeMCU/ESP8266, Arduino Uno, ATtiny85, NRF51822, sensor modules, MT7688
Programming: Java, C, NodeJS, Lua, Arduino, OpenWRT, Linux, Android, Android Things, mBed.
Description: Implementing end to end solution along with mentoring the engineering team. End sensor node firmware development with programming. Gateway research and development with programming. Integration to cloud. MEAN stack implementation. Hardware selection and proposal creation to fit in system design and BOM. Some R&D on development strategy to reduce effort and money to reduce end product cost. Also developed a few 3D enclosure mechanical models with fusion 360 and 3D printed for MVP demo. Worked with contractors to develop PCB manufacturing and assembly. Partner and supplier built-up.

[startup] **IoT gateway development**
Platform: NodeJS, Node-RED, Yocto Linux, Kaa SDK
Description: Added C++ SDK interface with JavaScript using NAN interface. IoT backend gateway implementation for fetching street data to analytics dashboard. Mentored a few engineers to build ESP32 based edge nodes and WiFi mesh. Worked with manufacturers to make the product market ready.

2006 to 2015

Android OS stack specification, design and development for Linaro
Description: Implemented Ara manager framework stack upon Qualcomm hardware system service, JNI, AIDL, HAL interface, binder, daemon and SDK library. Worked closely with Linaro and Google architect. HLD and LLD design, implementation in JAVA, C and C++. Worked with domains, kernel, MCU firmware and cloud team for concept and design discussion. Visited Google HQ at MV, California, US; Linaro meetup at Boston, US; San Francisco, US for implemented solution integration to the device and to sync with other teams.

IoT server automation framework, Android

Platform: JAVA, Ubuntu, Tradefed, Android, MQTT, Android Studio
Description: MQTT mock server setup within LAN, server stub implementation in Java, MQTT and HTTP message traffic simulation from server and mobile app. Issue analysis with tcpdump and wireshark. SDP and SIP protocol analysis for an IP phone based solution issue fixes.

VOIP audio and SIP implementation, Android
Description: Implementation update and bug fixing for VOIP solution based on SDP, SIP. Also, identified suitable audio compression solution, speex, and added to the implementation through research upon available optimal solutions. Did benchmarking the developed solution with different field scenario simulations.

MM1 proxy server development
Description: Implemented MM1 proxy server RFC single handedly for telecom messaging server protocols for frame and PDU parsing and packing. Implemented logic to take SMS and MMS traffic over IoT protocol stack based on MQTT and HTTP.

Android customization, HAL and JNI development on Qualcomm Snapdragon S2

Role: Technology research, solution development at android framework (JNI, HAL and system services) and application development with the help of my team of 4-6 engineers, mentoring them and self coding.

Soaris and RedHat OS issues root case finding

Description: Debugging, root cause analysis and fixing Linux OS issues with the help of kernel logs and system logs.

BREW OEM developer for Samsung phones

Description: Worked as BREW OEM engineer for CDMA phones, based on Qualcomm ARM core hipsets - QSC6030, QSC6075. NAND ROM customization, RAM dump analysis and fixing complex issues by low level debugging (C and assembly programming) with Trace32 debugger. Getting test engineers involved and RR certification done with Qualcomm. Interaction with telecom companies for software issues and resolving/closing the issues. Worked for telephony (wireshark tool, QXDM), and middleware development.Was responsible for BREW OEM layer for CDMA Asia and Africa regions, specially India and Thailand.Travelled to Thailand for product release support.

BREW platform stability on Kyocera phones on Qualcomm Hardware

Platform: Qualcomm MSM chip-ARM9, Trace32, QXDM, QPST, ethereal [ARM, phone firmware] | Programming: C
Description: Worked for BREW platform based CDMA phones for the US market; Used Trace32 debugging tools with good understanding of ARM9 architecture, QXDM; was involved in extending interface layer, worked with L4 microkernel, RAM dump analysis for fixing low level crash issues.

Android Telephony Framework and RIL Changes

Description: Code change estimation; modified RIL daemon and library to implement support call routing, within phone, between cellular network and wifi network based on certain parameters. Modified request handling part coming from the upper application layer.

Android Audio stack analysis and HAL changes

Platform: Android [Android framework, Audio, HAL]
Description: TinyAlsa, Audioflinger, audio policy manager, Linux audio pseudo driver. Doing some minor changes at Audio HAL.

Android porting, Intel and TI SoCs

Description: Android, Intel Atom, OMAP3, GRUB bootloader, Linux file system, Linux kernel, Android HAL, Android system services and JNI. Ported Android stack into x86 based rugged tablet device with Grub bootloader configuration, debugging at HAL layer. Built custom ROM image. Debugging and fixing hardware bringup issues such as mesa display lib, bluez, wifi wpa supplicant, serial interface. Ported Android into TI OMAP3 along with u-boot and customised kernel training and mentoring a small team. Mentored team for application development. Experiment execution of Xen hypervisor in intel platform.

Android framework stability

Duration: February 2011 to May 2011
Platform: Qualcomm MSM chipset-ARM9, Trace32, Android file system | Programming: C, C++, Java
Description: Android framework development, finding issue root cause at android framework and fixing independently.

Samsung platform stability on Samsung phones

Duration: November 2008 to February 2009
Platform: Qualcomm MSM chip-ARM9, Trace32, QXDM, QPST, ethereal [ARM, phone firmware]
Description: Wrote code for RUIM interface driver by using SAP native low level platform and to expose APIs to OEM layer with parsed data to the app layer; involved into fixing raised issues.

Qualcomm and Kyocera native platform stability on Qualcomm Hardware

Duration: November 2006 to July 2007
Platform: Qualcomm MSM chip-ARM9, Trace32, QXDM, QPST, ethereal[ARM, Phone firmware] | Programming: C
Description: Worked for CDMA phones; Used debugging tools Trace32 JTAG, QXDM Qualcomm logger. Worked for the call-processing module; was more involved in debugging issues at ARM low level code with understanding of ARM9 assembly codes; debugging REX kernel.

Automotive rig development

Duration: Jan 2006 to October 2006
Platform: PIC microcontroller - PIC16F84A [Hardware design]
Description: Microchip Assembly coding, C, Circuit designing around microcontroller, PCB designing for Multilink India. Worked with production lines to understand tools and limitations. Got a solution proposal selected with new electronic circuit and firmware design (in assembly coding) which reduced production line QA error from 30% to 0% and was put in use in the production line. Did firmware development for engine heating ECU development.
